

Appliance has a body with a spring-supported coupling rod installed in it. In the body right-angled slots are provided for installation of cutting slips in those, the slips can move in radial direction at the rod, on which they are mounted by means of coupling in the form of a "dovetail", axial displacement. To increase the quality of the inner surface of the string preparation for installing the packer, in the lower part of the body a rolling-off is placed, this one has a spindle rigidly fixed to a movable rod, conical rollers, which are installed in the slots of the body, with possibility to interact in working position with the inner surface of the drive pipe.
