

A method of growing potato includes making a furrow with banks in the soil, applying the primary layer of fertilizers into the lower part of the furrow, laying potato tubers onto the layer of fertilizers, covering them with a layer of the soil from the banks, another application of a layer of fertilizers, poring the furrow with water following the appearance of potato seedlings and covering up the furrow with a layer of soil. The method includes also applying insecticides together with water against Colorado potato beetle and growth stimulants of potato. The use of the method allows speeding up the development of potato and improving in its yield due to the fertilizer dilution, moistening of the soil.
