

To drill wells that are inclined in the long plane of the workbench, and in the transverse plane as well, and those ones inclined in planes occupying intermediate positions, the drill workbench is equipped with a stand that can rotate in transverse plane of the workbench round a horizontal axis. On the stand a platform is installed, with a mast hinges to it, with possibility of inclination in the long plane of the workbench. Turn of the stand is restricted in the limiting inclined position by a completely stacked hydro-cylinder, and in vertical position – by a support on the stand being in contact with the platform.
