

The method for treating the pyo-inflammatory complications in patients with hemophilia relates to the medicine, in particular to the field of hematology. To optimize the treatment of the pyo-inflammatory complications in patients with hemophilia the complex therapy performed at the stage of the manifestation of the pyo-inflammatory process is complemented with sorbent Silard applied onto the wounds and parenteral administration of the allogenic anti-infection blood preparations specific for the peculiar etiologic factor. The realization of the method enables to decrease the duration of the stationary treatment and accelerate two-folds the clearing of the wounds.
