

The proposed device for training in writing with sound and light accompaniment contains a sound-frequency signal generator, a pen simulator, a connector, conductive paths corresponding to digit or letter lines, a current indicator, and a light indicator. As the said conductive paths, graphite paths are used that are applied by the teacher in the pupil's writing-book by using a pencil. The current indicator is connected to the pen simulator and, via the connector, to the conductive paths. The outputs of the current indicator are connected accordingly to the input of the generator and the input of the light indicator.
