

Foaming composition for restriction of the stratal water inflow to a well is used in gas-and-oil producing industry, in particular for restriction of the stratal water inflow to a well. This includes foaming agent and water, where as foamer composition includes black caustic sulfate, and additionally includes foam stabilizer as polyethyleneoxide, at the following component ratio, mass. %: foaming agent 30 – 70, foam stabilizer 1 – 5, water – the rest. Technical result is in increase of insulation characteristics of the composition due to improvement of the structural-mechanical properties of the foam obtained.
