

This invention relates to the area of machine-building, in particular, to the systems of gas supply for provision with compressed fuel gas, and can be used at vehicle compressor stations. System for gas supply for vehicles has a compressor, block for drying, gas accumulator, expansion tank, this is installed at the line of gas feeding. Gas accumulator comprises of sections, each of those has feeding line with a drive valve; the feeding lines are connected to each other with a pipeline with a back valve. Such implementation of the invention is to make it possible to increase functional possibilities of the system.
