

The proposed high-voltage bushing contains a casing with a spring contact and an insulating bush with a contact element. To provide reliable connection, the contact element, on the one side, is fixed to the bush that rests against a seal, and on the other side, is pressed by the spring contact that engages the bush opening on the other side of the casing. As the contact element, a pin or blade contact is used. To the contact element, a conductor is connected. At the base member of the spring contact, an opening for a current-conducting element is provided. The casing is closed with a cap, in which the spring contact is installed.
