

The invention relates to the dentistry, in particular to the method for treating the inflammatory and inflammatory-destructive processes in parodontum. Lipin is injected into the mucous membrane as 10% suspension in saline solution at a dose 1 ml into the transitional folds of the jaws. Then the paste is inserted into the parodontal pouches. The paste consists of the equal parts of lipin and tannin and 0.1 ml of the oil solution of vitamins A and E. The paste is inserted for 2-3 hours under the hardening paraffin bandage.
