

End pad for butt insulating rail joint has head, web, those follow cross section rail profile, and base with the lower facet going out of cross-section rail profile. To prevent formation of electroconductive layer side facets of base of pad and ends of its upper facet go out of cross section of rail by distance equal to 0.03-0.05 of width of the base of the rail. Upper facet edges of pad base are arranged in parallels to lower facet and its length makes 0,13-0,31 of width of rail base. At that the lower facet of the base of the pad goes out of the transverse profile of rail by distance equal to 0.02-0.06 of width of the base of the rail.
