

The invention relates to mechanical means in agriculture, in particular to dryers for drying cereal crops, and can be used in large farmer economies and in small ones as well. A heat chamber of drier is equipped besides scraper mixer with at least one additional mixer installed on one shaft with scraper mixer. Additional mixer looks like cross with hub in center, with parallel to bottom four holders. To the holders at above and at beneath without possibility of motion axles of hinges with blades fit on those are attached, those are placed symmetrically with respect to axis of rotation and the hub. Loading tank looks like twin truncated cone with gate in the upper part. The invention provides improvement of quality and decrease of drying time.
