

The invention relates to coils and can be used in cash flow, while making medals and token coins. A coil comprises moving elements arranged in a hollow of a body thereof. Each of the moving elements is made as a sounding part of a self-speaking musical instrument and arranged in such a manner as to allow encountering the body of the coin. The properties peculiar to a miniature musical instrument are imparted to the coin. Emission usefulness thereof is increased, the degree of protecting the coil from falsification and loss is raised.
