

The invention relates to build materials, namely to organosilicon compositions on the basis of organosilicon resin and low-molecular siloxane rubber which can be used as a moisture retardant for the building structure protection from destructive environmental action, and also for interfering gluing unsanctioned advertisement and other paper products.

Also the invention extends the region of using of protective compositions and increases their antiadhesive properties.

The protective composition contains organosilicon resin, low-molecular polymethylsiloxane rubber, mixture of loadings, methyltriacetoxysilane, and defoaming agent - surface-active substance, and a solvent.
