

A method for separation of lids from a filter element of oil filter, which consists of a shutter, a central perforated tube and end caps, which involves damage of integrity of the filter element. Damage of the filter element integrity is performed by installing thereof with the cap next to a support mounted on a plate of device for detachment of the cap having a detaching element in the form of a rod to move in a plane parallel to the plate with an effort sufficient to detaching the cap, then the separating element is displaced up to complete cap detachment, the filter element is overturned and the procedure of detachment of the second cap is repeated.
