

Finishing profile for window and door openings comprises two profile parts connected to each other by means of bending one with respect to the other by angle α , for attachment to the walls and corners of the window or door opening. To obtain a more rigid construction and for increase of reliability, the finishing profile is formed by the inner connection of both parts of the profile with thickness A and B by means of metal strip, at that the ends of both parts of the profile at joint have respective bevels at angle, and the front surface has decorative coating.
