

Device for manufacturing briquettes comprises frame of matrix, punches, the mechanism for creating a pressed force, feeder, transporter for collecting the finished briquettes. To increase the strength and density of the briquettes on a frame manufactured in the bottom in the form of a platform with a circular groove for placing matrices rigidly mounted energy power unit for a static compression, trays for pouring of pressed mixture, pulse energy power unit for the final forming of the briquette and the ejector of the finished briquette and at the platform mounted a circular movement mechanism with stepper device rigidly connected to the matrix, equipped at the bottom with piles placed in the groove of the circular platform, and piles matrix are upper than the depth of the groove a circular platform.
