

A method for making a breloque includes cutting base blanks coating an image onto the substrate, forming a frame-bearing-protective layer and installing a fastener. Transparent polymeric sheet material is used as the base. The image is coated by a undetachable method on the both or one side of the base with a shift from the edge of 0.1-10.0 mm. After that alternative pouring up to the edges of the base is carried out by the a transparent layer of a two-component solid two-component epoxy or a two-component polyurethane rigid coating, or a rigid polyester or acrylic solid coating, or a solid UV-solidifying coating of 0.1-10 mm in thickness. Installation of a key ring is carried out carried out using a metal swivel, placed in a grove, formed on the upper part of the breloque's body and filled with a solidifying polymer. Simplifying and reduce the cost of making the breloque, increasing in consumer's properties and increase in service life thereof are provided.
