

The invention relates to a closing device (1) for containers (2), having a closing part (6), by means of which an opening (5) of the container (2) can be closed and which has closing part-side holding elements (8), and container-side holding elements (9) which are arranged on a container outlet region (4) that has the opening (5) of the container (2) and with which the closing part-side holding elements (8) can be brought into engagement when closing the opening (5) of the container (2). In order to allow the containers (2) to be paired with a specific type, class, size, or the like and/or a specific manufacturer, the container-side holding elements (9) are designed as identification features or have identification features.
