

The proposed device for assessing articles of collection that are selected for realization contains a data base that is designed for storing data on the assessment criteria and the cost of the articles, a unit for data input/output, a random access memory unit, a data processor, a control unit, and additionally, an interface for the random access memory unit, a buffer memory unit for data input/output, a unit for determining the base cost of the articles, a unit for determining the current cost of the articles, and a unit for displaying data. All the said units are connected to each other in a certain manner.
