

The inventive device relates to devices for remotely informing a user about the calls of a mobile cellular transmission terminal (cellular telephone) or about short messages (SMS) and can be used for wireless communications systems and domestic appliances. Said invention makes it possible to reliably inform the user located far from the mobile cellular transmission terminal in conditions when the mobile cellular transmission terminal thereof is unable to receive information signals about the call or the SMS message. For this purpose, the inventive device comprises a microwave field detector and is located at such a distance from the mobile cellular communications terminal which enables said detector to be operable. In various variants, the inventive device also comprises a loud sound signal generator, a bright oriented light signal generator, a communications unit and an external warning signal generator. In one of variants, said device is embodied in the form of a radiocommunications device.
