

A flat car for large-size sheet products of different length comprises a carrying frame leaning on an undercarriage and a load-bearing rotary platform equipped with mechanical stops against longitudinal displacement of cargo and a device for its securing having docking surfaces for arrangement of the cargo. The load-bearing rotary platform is equipped with support elements, which are hinged in vertical position, and in horizontal position are located below the level of docking surfaces at equal distances from the end-stops, which are intended to limit the longitudinal displacement of the cargo of smaller range of length.
