

A method for implementation of information technological services comprises the use of the mobile computing devices in the education and the adjacent fields. The programmed technical complex with the module architecture is developed. With this aim in view, the polytechnological server module is introduced supporting the arbitrary communication protocol with client devices and the set of multifunctional loaded software intended for interaction with the end-user client modules capable of integrating into the mobile phones, smart phones, communicators, personal information assistants, e-books, media players, handheld computers.
