

A method for the prize draw in Internet provides for ciphering the information onto the paper carrier and deciding the winner provided that the information is matched to the deciphered one. Namely, the paper carrier contains the identification information. Base on the ciphered information, the player transfer the deciphered information to the central processor via Internet. Upon receiving the signal of deciphered information, the central processor identifies it with previously ciphered information. In the case of matching, the positive signal is directed to the remote terminal unit.
