

A method for disposal of domestic waste on disposal fields includes collecting into containers, transportation by technical means. Domestic waste is collected in a plastic underground container made with a trap and a loading box with a grating bottom. To the container together with liquid waste solid processed organic waste is added. Extraction, transport, unloading and placing in the fields of domestic waste of the filled plastic container are made by a sludge-suction machine, or spreaders of liquid fertilizers. Neutralized domestic waste with a layer of soil are piled, enriched with chemical fertilizers and transported to customers.
