

A wall clock has bearing board with representation of clock face and clock mechanism attached to the board reverse side. Hands of a clock are arranged at the front of the board. The bearing board consists of a base as a plate, one side of which has decorative coating, and to the reverse side thereof the clock mechanism is attached, and a glass plate with clock face representation, arranged at distance from the base and attached thereto. The hands are placed from the side which has decorative coating and between the base and glass plate.
