

A protecting individual mask is made as a plate, the relief of which corresponds to the relief of a human face, with the availability of eye holes. It is supplemented with a nasal part, an above-front stop, cheek stops, ocular locks, an occipital belt with a tension regulator, cuts, outer and internal pockets, openings. In doing so the outer and internal pockets is made and fixed to a plate pairwise in the nasal part, above-front stop and the cheek stops. The bottom of the nasal part is made as that hollow, the ocular locks are fixed in the same horizontal plane with centres of the eye openings, the cuts are made on sides of the above-front stop and the cheek stops, and in the cuts the occipital belt with the tension regulator is mounted hingedly. The plate is made of polycarbonate plastic, and the occipital belt is made of rubber-fabric material.
