

The evacuation device for transportation of the wounded persons contains the rectangular base and the appliances for the fixation of the person containing three pairs of the metallic half-rings and the fastening belt passing through them. The rectangular base is made of foaming polypropylene lined with the durable fabric. The ends of fastening belt are sewed together as the straps. Each pair of the metallic half-rings is located along the borders of the rectangular base above and beneath the base at the level of the thorax of the wounded person. The pairs of the metallic half-rings are connected rigidly to the base. In addition, the device is equipped with at least two textile bands as the appliance for packaging the device and the fixator for suspending the device to the belt.
